

## Portfolio Project: Pod-Snapper.com

Mission: To create a podcast platform that allows users to not only listen to podcast but capture a portion of the audio feed--transcribe it--and save it as text into their favorite note-taking system.

1. The purpose of this portfolio project is to start the concept of this application idea. I understand that the project as a whole is a huge undertaking and am taking that into consideration for this project. I will be focusing mostly on the user registration portion of the app as it will utilize the skills I have learned thus far.
2. The desktop interface will include the following features which will use bootstrap and react:
  - Navbar: header and footer
  - Single Page Application
  - A registration page with bootstrap fields.
  - It will use map to check and see an email already exist in the system.
  - A browse page for searching new podcast to listen to
    - This will include components and objects that will store specific information about each podcast.
    - It will use react card containers that will provide a visual layout of the various podcast.
  - It will contain a fixed media player that will be an on-page widget.

### 3. Navigation Structure

- Home page: Info, download app, Navbar header
- Browse: All available podcast to listen to.
  - This card view will also provide an additional card view of info about the podcast when selected.
- Library: User Saved podcast
- Search bar: direct link to podcast components

### 4. Stitcher.com, apple podcast
